

微积分2023-2024(1)-2期末参考答案

一、简算题(每小题5分, 共25分).

1. 设互相垂直的单位向量 a, b 满足 $(a+2b) \perp (ka+b)$, 求常数 k 的值.

解 $0 = (a+2b) \cdot (ka+b) = k|a|^2 + 2|b|^2 = k+2, \therefore k = -2$.

2. 求旋转抛物面 $z = x^2 + y^2$ 与平面 $z = 1$ 围成空间区域 Ω 的体积.

解 $V = \iint_{x^2+y^2 \leq 1} (1-x^2-y^2) dx dy = \int_0^{2\pi} d\theta \int_0^1 (1-r^2) \cdot r dr = \frac{\pi}{2}$.

3. 设 $L: y = \sqrt{1-x^2} (-1 \leq x \leq 1)$, 求曲线积分 $\int_L (x+y)x ds$.

解 由对称性, 原式 $= \int_L x^2 ds = \int_0^\pi \cos^2 \theta d\theta = \frac{\pi}{2}$.

4. 求曲面 $(x^2 + y^2 + z^2)^2 = 9z$ 上点 $(1, 1, 1)$ 处的切平面方程.

解 令 $F = (x^2 + y^2 + z^2)^2 - 9z$, 则 $F'_x|_{(1,1,1)} = 4x(x^2 + y^2 + z^2)|_{(1,1,1)} = 12$, 同理 $F'_y|_{(1,1,1)} = 12$,

$F'_z|_{(1,1,1)} = 3$, 故切平面方程为 $4(x-1) + 4(y-1) + (z-1) = 0$, 即 $4x + 4y + z - 9 = 0$.

5. 将函数 $f(x) = x (0 \leq x < \pi)$ 展开成以 2π 为周期的正弦级数 $\sum_{n=1}^{\infty} b_n \sin nx$, 求 b_2 的值.

解 $b_2 = \frac{2}{\pi} \int_0^\pi x \sin 2x dx = \frac{2}{\pi} \int_0^\pi x \sin 2x dx = -1$.

二、计算题(每小题8分, 共40分).

1. 设 $z = \arctan \frac{x-y}{x+y}$, 且 $x^2 + y^2 \neq 0$, 求 $x \frac{\partial z}{\partial x} + y \frac{\partial z}{\partial y}$.

解 $\frac{\partial z}{\partial x} = \frac{1}{1 + (\frac{x-y}{x+y})^2} \cdot (\frac{x-y}{x+y})'_x = \frac{y}{x^2 + y^2}$; 同理 $\frac{\partial z}{\partial y} = \frac{-x}{x^2 + y^2}$. 故(4分)

$x \frac{\partial z}{\partial x} + y \frac{\partial z}{\partial y} = x \frac{y}{x^2 + y^2} + y \frac{-x}{x^2 + y^2} = 0$(4分)

2. 设 $\vec{l}$ 是直线 $\begin{cases} 4x - y - z = 1 \\ 2x + y - 2z = 2 \end{cases}$ 的方向向量(与 z 轴的夹角为锐角), 求函数 $u = \ln(\sqrt{x^2 + y^2} + z)$

在点 $(1, 1, 0)$ 处沿方向 $\vec{l}$ 的方向导数 $\frac{\partial u}{\partial \vec{l}}$.

解 由题意, $\vec{l}$ 可取为 $\begin{vmatrix} i & j & k \\ 4 & -1 & -1 \\ 2 & 1 & -2 \end{vmatrix} = (3, 6, 6)$, 故 $\vec{l}^0 = \frac{1}{3}(1, 2, 2)$(3分)

$\frac{\partial u}{\partial x}|_{(1,1,0)} = \frac{d \ln(\sqrt{x^2+1})}{dx}|_{x=1} = \frac{1}{2}$, 同理 $\frac{\partial u}{\partial y}|_{(1,1,0)} = \frac{1}{2}$, $\frac{\partial u}{\partial z}|_{(1,1,0)} = \frac{1}{\sqrt{2}}$(3分)

所以 $\frac{\partial u}{\partial \vec{l}}|_{(1,1,0)} = \frac{1}{2} \cdot \frac{1}{3} + \frac{1}{2} \cdot \frac{2}{3} + \frac{1}{\sqrt{2}} \cdot \frac{2}{3} = \frac{1}{2} + \frac{\sqrt{2}}{3}$(2分)

3. 求函数 $z = x^3 + y^3 - 3xy$ 的极值.

解 由 $\begin{cases} z'_x = 3x^2 - 3y = 0 \\ z'_y = 3y^2 - 3x = 0 \end{cases}$, 解之得驻点 $P_1(0, 0)$, $P_2(1, 1)$(3分)

令 $A = z''_{xx} = 6x$, $B = z''_{xy} = -3$, $C = z''_{yy} = 6y$(2分)

当为驻点 P_1 时, $B^2 - AC = 9 > 0$, 非极值点;

当为驻点 P_2 时, $B^2 - AC = -27 < 0$, $A = 6 > 0$, 极小值 $z(1, 1) = -1$(3分)

4. 计算二次积分 $\int_0^1 x^2 dx \int_{x^3}^1 \frac{\sin y}{y} dy$.

解 (如图) 原式 $= \iint_D x^2 \frac{\sin y}{y} dx dy$

$$= \int_0^1 dy \int_0^{\sqrt[3]{y}} x^2 \frac{\sin y}{y} dx$$

$$= \frac{1}{3} \int_0^1 \sin y dy = \frac{1}{3}(1 - \cos 1).$$

.....(6分)

.....(2分)

5. 求幂级数 $\sum_{n=1}^{\infty} \frac{3n^2+1}{2n} x^n$ 的和函数.

解 $\sum_{n=1}^{\infty} \frac{3n^2+1}{2n} x^n = \frac{3}{2} \sum_{n=1}^{\infty} nx^n + \frac{1}{2} \sum_{n=1}^{\infty} \frac{x^n}{n}$ (2分)

$$= \frac{3}{2} \frac{x}{(1-x)^2} - \frac{1}{2} \ln(1-x)$$

$$x \in (-1, 1)$$

.....(2分)

三、解答题(每小题9分, 共27分).

1. 设曲面 Σ 是球面 $z = \sqrt{2 - x^2 - y^2}$ 被锥面 $z = \sqrt{x^2 + y^2}$ 截出的顶部, 求 Σ 的面积和形心

$$\text{解 由 } \begin{cases} z = \sqrt{2 - x^2 - y^2} \\ z = \sqrt{x^2 + y^2} \end{cases}, \text{ 得 } \begin{cases} z = 1 \\ x^2 + y^2 = 1 \end{cases}.$$

$$\begin{aligned} S &= \iint_{D_{xy}} \sqrt{1 + (z'_x)^2 + (z'_y)^2} dx dy = \iint_{D_{xy}} \frac{\sqrt{2}}{\sqrt{2 - x^2 - y^2}} dx dy \\ &= \int_0^{2\pi} d\theta \int_0^1 \frac{\sqrt{2}}{\sqrt{2 - r^2}} r dr = (4 - 2\sqrt{2})\pi \dots\dots\dots(5 \text{分}) \end{aligned}$$

易知 $\bar{x} = \bar{y} = 0$. 且

$$\begin{aligned} \iint_{\Sigma} z dS &= \iint_{D_{xy}} \sqrt{2 - x^2 - y^2} \sqrt{1 + (z'_x)^2 + (z'_y)^2} dx dy = \iint_{D_{xy}} \sqrt{2} dx dy = \sqrt{2} \pi \\ \therefore \bar{z} &= \frac{\iint_{\Sigma} z dS}{\iint_{\Sigma} dS} = \frac{\sqrt{2} \pi}{(4 - 2\sqrt{2})\pi} = \frac{\sqrt{2}}{4 - 2\sqrt{2}} = \frac{1}{2\sqrt{2} - 2} = \frac{\sqrt{2} + 1}{2}. \dots\dots\dots(4 \text{分}) \end{aligned}$$

2. 已知 L 是第一象限中从原点 $O(0, 0)$ 沿圆周 $x^2 + y^2 = 2x$ 到点 $A(2, 0)$, 再沿圆周 $x^2 + y^2 = 4$ 到点 $B(0, 2)$ 的曲线段, 计算曲线积分

$$I = \int_L 3x^2 y dx + (x^3 + \frac{1}{2}x^2 - 2y) dy.$$

解 添加辅助有向线段 $\overline{BO}$, 其中

$$P = 3x^2 y, Q = x^3 + \frac{1}{2}x^2 - 2y, \frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} = x, \text{ 由格林公式}$$

$$\begin{aligned} I &= \oint_{L+\overline{BO}} - \int_{\overline{BO}} = \iint_D x dx dy - \int_{\overline{BO}} (x^3 + \frac{1}{2}x^2 - 2y) dy \dots\dots\dots(4 \text{分}) \\ &= \int_0^{\frac{\pi}{2}} d\theta \int_{2\cos\theta}^2 r \cos\theta \cdot r dr - \int_0^2 2y dy \\ &= \frac{8}{3} \int_0^{\frac{\pi}{2}} (\cos\theta - \cos^4\theta) d\theta - 4 = -\frac{\pi}{2} - \frac{4}{3}. \dots\dots\dots(5 \text{分}) \end{aligned}$$

3. 计算第二类曲面积分 $I = \iint_{\Sigma} (x^3 z + xz) dydz - (x^2 yz - yx) dzdx - x^2 z^2 dxdy$, 其中有向曲面 $\Sigma: z = \sqrt{x^2 + y^2}, 0 \leq z \leq 1$, 取下侧.

解 添加辅助有向平面 $\Sigma_1: z = 1, x^2 + y^2 \leq 1$, 取上侧.

$$P = x^3 z + xz, Q = -(x^2 yz - yx), R = -x^2 z^2, \frac{\partial P}{\partial x} + \frac{\partial Q}{\partial y} + \frac{\partial R}{\partial z} = z + x.$$

由高斯公式及对称性,

$$\begin{aligned} I &= \oiint_{\Sigma + \Sigma_1} - \iint_{\Sigma_1} = \iiint_{\Omega} (z + x) dv - \iint_{\Sigma_1} -x^2 z^2 dxdy \quad \dots\dots\dots(4分) \\ &= \int_0^1 dz \iint_{D_z} z dxdy + \iint_{x^2+y^2 \leq 1} -x^2 dxdy \\ &= \pi \int_0^1 z^3 dz + \int_0^{2\pi} d\theta \int_0^1 r^2 \cos^2 \theta \cdot r dr \\ &= \frac{\pi}{2} \quad \dots\dots\dots(5分) \end{aligned}$$

四、证明题(8分).

1. 设 $a_n = \frac{4n + \sqrt{4n^2 - 1}}{\sqrt{2n+1} + \sqrt{2n-1}}, n \geq 1, S_n = \sum_{k=1}^n a_k$, 判断级数 $\sum_{n=1}^{\infty} \frac{(-1)^n}{\sqrt{n+1} S_n^p} (p > 0)$ 是绝对收敛还是条件收敛, 并证明你的结论.

解 当 $0 < p \leq \frac{1}{3}$ 时, 级数条件收敛; 当 $p > \frac{1}{3}$ 时, 级数绝对收敛, $\dots\dots\dots(2分)$

$$\begin{aligned} a_n &= \frac{(\sqrt{2n+1})^2 + \sqrt{2n-1}\sqrt{2n+1} + (\sqrt{2n-1})^2}{\sqrt{2n+1} + \sqrt{2n-1}} \\ &= \frac{(\sqrt{2n+1})^3 - (\sqrt{2n-1})^3}{(2n+1) - (2n-1)} = \frac{(2n+1)^{\frac{3}{2}} - (2n-1)^{\frac{3}{2}}}{2} \end{aligned}$$

$$\therefore S_n = \sum_{k=1}^n a_k = \sum_{k=1}^n \frac{(2k+1)^{\frac{3}{2}} - (2k-1)^{\frac{3}{2}}}{2} = \frac{1}{2} ((2n+1)^{\frac{3}{2}} - 1). \quad \dots\dots\dots(4分)$$

因此当 $n \rightarrow \infty$ 时, $\frac{1}{\sqrt{n+1} S_n^p} \sim \frac{1}{2^{\frac{p}{2}}} \frac{1}{n^{\frac{1+3p}{2}}}$, 若 $\frac{1+3p}{2} > 1$, 即 $p > \frac{1}{3}$ 时, 由比较审敛法知

原级数绝对收敛.

当 $0 < p \leq \frac{1}{3}$ 时, 易知 $\frac{1}{\sqrt{n+1} S_n^p} = \frac{1}{\sqrt{n+1} [\frac{1}{2} ((2n+1)^{\frac{3}{2}} - 1)]^p}$ 单减且以 0 为极限, 故由

莱布尼兹审敛法知原级数条件收敛. $\dots\dots\dots(2分)$
